Description

Fused quartz or fused silica is glass consisting of silica in amorphous (non-crystalline) form. It differs from traditional glasses in containing no other ingredients, which are typically added to glass to lower the melt temperature. Fused silica, therefore, has high working and melting temperatures. The optical and thermal properties of fused quartz are superior to those of other types of glass due to its purity. For these reasons, it finds use in situations such as semiconductor fabrication and laboratory equipment. It has better ultraviolet transmission than most other glasses, and so is used to make lenses and other optics for the ultraviolet spectrum. Its low coefficient of thermal expansion also makes it a useful material for precision mirror substrates.

Global High-grade Fused Quartz key players include Heraeus Holding, Tosoh, Momentive, etc. Global top three manufacturers hold a share about 45%.

Europe is the largest market, with a share over 35%, followed by Japan, and North America, both have a share about 50 percent.

In terms of product, Clear High-grade Fused Quartz is the largest segment, with a share nearly 80%. And in terms of application, the largest application is Semiconductor Industrial, followed by Precision and Detection Optics, Lamp Applications, etc.
