Description

Polymyxins are antibiotics, with a general structure consisting of a cyclic peptide with a long hydrophobic tail. They disrupt the structure of the bacterial cell membrane by interacting with its phospholipids. They are produced by nonribosomal peptide synthetase systems in Gram-positive bacteria such as Paenibacillus polymyxa and are selectively toxic for Gram-negative bacteria due to their specificity for the lipopolysaccharide molecule that exists within many Gram-negative outer membranes. At least eleven different members of the polymyxin group have been identified and they are designated by a suffix letter. They demonstrate specific activity against gram-negative bacteria such as Proteus vulgaris, Escherichia coli, Hemophilus influenzae, Aerobacter aerogenes, Klebsiella pneumoniae and especially Pseudomonas aeruginosa.

Polymyxins B and E (also known as colistin) are common types of polymyxins. Polymyxins B is used for the treatment of human Gram-negative bacterial infections, while polymyxins E is used for animal husbandry. Global Polymixin key players include Shengxue Dacheng , Apeloa, Livzon Group , LKPC, Xellia, etc. Global top five players hold a share about 50%.

Asia-Pacific is the largest market, with a share about 45%, followed by Europe and North America, having a total share about 40 percent.

In terms of product, Oral is the largest segment, with a share about 85%. And in terms of application, the largest application is Chickens, followed by Pigs, Cows.
