Description

Thermoelectric materials show the thermoelectric effect in a strong or convenient form.

The thermoelectric effect refers to phenomena by which either a temperature difference creates an electric potential or an electric potential creates a temperature difference. These phenomena are known more specifically as the Seebeck effect (converting temperature to current), Peltier effect (converting current to temperature), and Thomson effect (conductor heating/cooling). While all materials have a nonzero thermoelectric effect, in most materials it is too small to be useful. However, low-cost materials that have a sufficiently strong thermoelectric effect (and other required properties) could be used in applications including power generation and refrigeration. A commonly used thermoelectric material in such applications is bismuth telluride.

Thermoelectric materials are used in thermoelectric systems for cooling or heating in niche applications, and are being studied as a way to regenerate electricity from waste heat.

Global Thermoelectric Material key players include Ferrotec, Laird, KELK, etc. Global top three manufacturers hold a share over 55%.

China is the largest market, with a share over 40%, followed by Japan and North America, both have a share over 35 percent.

In terms of product, Bi-Te is the largest segment, with a share over 85%. And in terms of application, the largest application is Automotive, followed by Electronics, Biomedical, etc.
