Description

Laser diodes are electrically pumped semiconductor lasers in which the gain is generated by an electrical current flowing through a p–n junction or (more frequently) a p–i–n structure. In such a heterostructure, electrons and holes can recombine, releasing the energy portions as photons. This process can be spontaneous, but can also be stimulated by incident photons, in effect leading to optical amplification, and with optical feedback in a laser resonator to laser oscillation.

The laser diode has electrons and positive holes combined to create light from the PN junction when a PN junction is made by combining an N-Type semiconductor & P-Type semiconductor while afterwards, having the currents injected as a forward current.

Global Laser Diode key players include Sony, Nichia, Sharp, Ushio, Osram, etc. Global top five manufacturers hold a share over 65%.

North America is the largest market, with a share over 25%, followed by Europe and China, have a share over 35 percent.

In terms of product, Blue Laser Diode is the largest segment, with a share about 30%. And in terms of application, the largest application is Industrial Applications, followed by Optical Storage & Display, Telecom & Communication, Medical Application, etc.
