### Description

A Signal Booster (also known as cellular repeater or amplifier), in the cell phone industry, is a device used for boosting the cell phone reception to the local area by the usage of a reception antenna, a signal amplifier, and an internal rebroadcast antenna. These are similar to the cellular broadcast towers used for broadcasting by the network providers, but are much smaller, usually intended for use in one building. Modern cellular repeater amplifiers can rebroadcast cellular signals inside a building. The systems usually use an external, directional antenna to collect the best cellular signal, which is then transmitted to an amplifier unit which amplifies the signal, and retransmits it locally, providing significantly improved signal strength. The more advanced models often also allow multiple cell phones to use the same repeater at the same time, so are suitable for commercial as well as home use.

Global Signal Booster key players include Wilson Electronics, SureCall, Stella Doradus, SmoothTalker, Comba, etc. Global top five manufacturers hold a share over 40%.

North America is the largest market, with a share over 30%, followed by China, and Europe, both have a share over 50 percent.

In terms of product, Digital Signal Booster is the largest segment, with a share nearly 55%. And in terms of application, the largest application is Densely populated areas, followed by Urban fringe, Suburban and rural areas, etc.

### Report Scope
