Description

VOC molecules are complex and easily broken down by high energy photons. VOC sensors use a bright ultraviolet light source to knock electrons out of the VOC molecule; the electrons are measured and their flow indicates that VOC molecules are present at the sensor. Each specific type of VOC molecule has an 'ionization potential' (IP) value that represents the amount of energy necessary to liberate an electron; this value is measured in 'electron volts', or eV. PID sensors have a specified level of energy, also measured in eV.

VOCs are commonly monitored as they are a key contributor in photochemical smog. Many are hazardous to human health, with several classified as carcinogenic. The key sources of VOCs are industrial processes (especially those involving solvents) vehicle emissions, evaporative loss from petrol storage and even natural sources like forest fires.

North America is the largest VOC Sensors and Monitors market with about 37% market share. Asia-Pacific is follower, accounting for about 29% market share.

The key players are Drägerwerk, AMS AG, Honeywell, 3M, FIGARO, Riken Keiki Co., Ltd, Navter, Siemens, GDS Corp, Aeroqual, Extech, Alphasense, Compur Monitors GmbH & Co. KG etc. Top 3 companies occupied about 31% market share.

Report Scope

This report quantifies the global VOC Sensors and Monitors market in terms of revenue (US\$ million) and, where applicable, service volume (), using 2024 as the base year and providing annual historical and forecast data for 2021–2032.
