Description

Flow drill screw driving (FDS) is a one-sided thermomechanical assembly process based on heat generation by frictional force and plastic deformation. A special screw, known as hole forming and self-tapping screw, is used in this process as both fastener and tool. Moreover, rotational and translation movements are applied to the screw to create special friction conditions with the workpiece. Furthermore, unlike traditional drilling and thread milling processes, there is no chip or waste of material in FDS and the machining operations are realized through plastic deformation. The report study flow drilling screw (FDS) and the driving machine.

On the basis of product type, the flow drilling screw (FDS) type segment represent the largest share of the worldwide market, with 53% share. In the applications, passenger cars segment is estimated to be the largest end-use industry segment of the market in 2019, with 86% share of global market. Europe holds the major share in the market, with a share of 48%.The Top 5 players accounted for 74% of the Global flow drilling screw (FDS) and driving machine revenue market share in 2019.
