Description

Injection molding machine (referred to as injection machine or injection molding machine) is the use of plastic molding mold thermoplastic or thermosetting material into various shapes of plastic products of the main molding equipment. The working principle of injection molding machine is similar to the syringe used for injection. It is with the help of the screw (or plunger) of the thrust, the plastic has been plasticized good melting state (i.e. viscous flow state) injected into the closed cavity of the mold, and the process of the product is obtained after solidification.

Injection molding is a cyclic process, each cycle mainly includes: quantitative feeding -- melt plasticizing -- pressure injection -- mold filling and cooling -- mold opening and taking parts. After removing the plastic parts, the mold is closed again and the next cycle is carried out. Injection molding is a cyclic process, each cycle mainly includes: quantitative feeding - melt plasticizing - pressure injection - mold cooling - open mold to take parts, take out plastic parts and then close the mold, the next cycle.

Injection molding machine is usually composed of injection system, mold closing system, power system, electrical control system, lubrication system, heating and cooling system, safety monitoring system and so on. Global core injection molding machine manufacturers include Haitian International, ENGEL Holding GmbH, KraussMaffei etc.The top 5 companies hold a share about 25%. China is the largest market, with a share about 65%, followed by Europe and Japan with the share about 12% and 10%. In terms of product, clamping force: 250-650T is the largest segment, with a share over 50%. And in terms of application, the largest application is commodity, followed by home appliance.
