### Description

The steam water heater system consists of two major components: a heat exchanger and a blending valve. The interaction of these two components provides instantaneous and continuous hot water, given a steady supply of steam and inlet water. The heat exchanger has inputs of steam and cold water that enter and stay separate via a coil or pipe system. The thermal difference of the two increases the temperature of the water, which is output to the blending valve. The thermal decline of the steam causes it to condense into water, which is then drained out.

Global Steam Water Heater key players include Armstrong, Patterson Kelley, PVI Industries, Hubbell Electric Heater, Spirax Sarco, etc. Global top five manufacturers hold a share nearly 45%.

North America is the largest market, with a share over 70%, followed by Asia-Pacific, and Europe, both have a share about 25 percent.

In terms of product, Semi-instantaneous is the largest segment, with a share about 45%. And in terms of application, the largest application is Buildings and Hotels, followed by Hospitals, Schools, Food and Beverage Industrial, etc.
