### Description

Thermal drying technology is based on removal of water from dewatered solids which accomplishes both volume and weight reduction. The added benefit of thermal drying is that it typically results in a product with significant nutrient value. Typically, dewatered solids (at approximately 18% to 35% dry solids content) are delivered to a thermal drying system, where most of the water is removed via evaporation resulting in a product containing approximately 90% solids. In the thermal drying system, the temperature of the wet solids mass is raised so that the water is driven off as a vapor. By removing most of the water from the solids, thermal drying results in a significant reduction in both volume and mass.

The major players in global Thermal Drying Dewatering Equipment market include Andritz AG, Veolia, Gea Group, etc. The top 3 players hold over 20% of global shares. Europe and North America are main markets, they occupy over 60% of the global market. Direct Type is the main type, with a share about 45%. Textile, Food and Beverage are the key applications, both hold a share over 20%.
