Description

Tissue processing describes the steps required to take animal or human tissue from fixation to the state where it is completely infiltrated with a suitable histological wax and can be embedded ready for section cutting on the microtome.

Tissue processing is a procedure of removing water from cells and replacing it with a medium which solidifies allowing thin sections to be cut on a microtome. Tissue processing is routinely done on an instrument called Tissue Processor.

The Tissue Processors is divided into Desktop Tissue Processors and Floor-standing Tissue Processors. Floor-standing Tissue Processors are the most widely used type, with a market share of about 77% in 2019.

The key raw materials of Tissue Processors are PVC, steel, and aluminum.

North America, Asia-Pacific and Europe are the top3 global organizations of Tissue Processors market share, with about 34%, 32% and 30%, respectively.

Leica Biosystems, Thermo Fisher Scientific, Sakura Finetek, Milestone Medical, Dakewe and Diapath are major suppliers of Tissue Processors worldwide.
