Description

Transmission electron microscopy (TEM) is an imaging technology in which electron beams pass through very thinly sectioned specimens. As the electrons are transmitted through the specimen and interact with its structure, an image resolves that is magnified and focused onto an imaging medium, such as photographic film or a fluorescent screen, or captured by a special CCD camera. Because the electrons used in transmission electron microscopy have a very small wavelength, TEMs can image at much higher resolutions than conventional optical microscopes that depend on light beams. Due to their higher resolving power, TEMs play an important role in the fields of virology, cancer research, the study of materials, and in microelectronics research and development.

Global Transmission Electron Microscope (TEM) key players include Thermo Fisher Scientific, JEOL, Hitachi, Delong, etc. Global top four manufacturers hold a share 100%.

Japan is the largest market, with a share over 65%, followed by United States and Europe, both have a share about 30%.

In terms of product, 80KV-200KV is the largest segment, with a share over 75%. And in terms of application, the largest application is Life Science, followed by Materials Science, etc.
