Description

Turbine gear box is typically used in a wind turbine to increase rotational speed from a low-speed rotor to a higher speed electrical generator. A common ratio is about 90:1, with a rate 16.7 rpm input from the rotor to 1,500 rpm output for the generator. It is important to ensure that the drivetrain effectively isolates the gearbox, or to ensure that the gearbox is designed to support these loads, otherwise internal gearbox components can become severely misaligned. This can lead to stress concentrations and failures.

Global Turbine Gear Boxes key players include Siemens, China Transmission, ZF, Moventas, VOITH, etc. Global top five players hold a share about 80%.

China is the largest market, with a share about 45%, followed by Europe and North America, having a total share about 45 percent.

In terms of product, 1.5 MW - 3 MW is the largest segment, with a share about 90%. And in terms of application, the largest application is Onshore, followed by Offshore.

Report Scope

This report quantifies the global Turbine Gear Boxes market in revenue (US\$ million) and, where applicable, sales volume (MW), using 2025 as the base year and providing annual historical and forecast data for 2021–2032.
