### Description

Wafer Grinder uses a centrally located robot to move a wafer from an input station to a measuring station. Thereafter, the wafer is moved into a grind station and a wash station sequentially. The robot is able to move a wafer from the wash station to either the measuring station for after-grinding measurements or directly to an output station. During grinding of one wafer, a second wafer may be held between the measuring station and the grind station while a ground wafer is moved from the wash station to the measuring station for after-grinding measurements.

The key players of Wafer Grinder include Disco, TOKYO SEIMITSU, etc. The top two players of Wafer Grinder account for approximately 78% of the total market. Asia-Pacific is the largest market of Wafer Grinder accounting for about 75%, followed by Europe and North America. In terms of Type, Wafer Surface Grinder is the largest segment, with a share about 77%. In terms of Application, the largest segment is Silicon Wafer, followed by Sapphire Wafer.
