Description

Transdermal Drug Delivery System is a medicated adhesive patch that is placed on the skin to deliver a specific dose of medication through the skin and into the bloodstream. Often, this promotes healing to an injured area of the body. An advantage of a transdermal drug delivery route over other types of medication delivery such as oral, topical, intravenous, intramuscular, etc. is that the patch provides a controlled release of the medication into the patient, usually through either a porous membrane covering a reservoir of medication or through body heat melting thin layers of medication embedded in the adhesive.

Global Transdermal Drug Delivery System key players include Hisamitsu, Mylan, GSK, Novartis, Teve (Actavis), etc. Global top five manufacturers hold a share over 65%. North America is the largest market, with a share over 40%, followed by Europe and Asia-Pacific, both have a share over 45% percent.

In terms of product, Nitroglycerin is the largest segment, with a share over 25%. And in terms of application, the largest application is OTC, followed by RX.
