Description

Spectral sensing refers to a technology which is used to determine the information about its material composition. This is done by shining a light on the object under consideration and then analysing the reflected light from the object to study its properties. Spectral filtering is commonly used to select a certain information or eliminate it from an image based on the wavelength of the information. Spectrum sensing is being recognized as a key application for cognitive radio technology. Spectral sensing filters are used to eliminate the unnecessary information associated with the object under consideration.

North America has the largest global production volume and manufacturers in Spectral sensing filter market, taking up 35.58% in 2019, while the Europe is the second production volume market for Spectral sensing filter in 2019. Viavi Solutions sales most in 2019 and recent years, while Shenzhen Gladsome and Edmund Optics ranked the second and the third. The market share of them are 13.19%, 8.16% and 4.95% in 2019. The gap of market share is keep on enlarged due to different strategy. Nowadays, according to the different light interception types, there are three major types of Spectral sensing filter, including dichroic filters, neutral density (ND) filters and band-pass filters.
