Description

Thromboelastography (Thromboelastography) is a new blood viscoelastic detection system suitable for bedside detection. It uses whole blood samples to monitor the whole process of blood coagulation and fibrinolysis, which can well make up for the deficiency of traditional blood coagulation detection.

Thromboelastogram provides a general picture of coagulation function. It is an inspection item that can dynamically monitor the whole process of coagulation and fibrinolysis. It can completely describe the whole process of a blood sample from coagulation initiation, coagulation and dissolution, and help doctors quickly judge the patient's coagulation status (high coagulation, low coagulation and fibrinolytic hyperactivity) and analyze the causes.

It is of great value in clinical evaluation of coagulation function, guidance of component transfusion, prediction of thrombosis/bleeding risk and guidance of medication.

Haemonetics, Werfenlife, Framar Hemologix SRL, Lepco Diagnostics, Sienco and so on are the main manufacturers of thromboelastography. The top five global manufacturers account for 77% of total sales. North America and Europe are the main production regions of thromboelastographs. North America accounts for 42% of the global production of thromboelastographs, ranking first in the world. Europe was next with 34 percent. North America is the world's largest consumer region of thromboelastograms, accounting for 39% of global sales. Europe was second with 21 percent.
